Since we are requested to not use the built-in `sum` function, let's first define a helper function which sums the elements of a vector:

```
sumFun <- function(x) {  
  sum <- 0  
  for (item in x) {  
    sum <- sum + item  
  }  
  sum  
}
```

Now, the `varFun` function can be defined as follows:

```
varFun <- function(x) {  
  len <- length(x)  
  mean <- sumFun(x) / len  
  
  square_error <- sumFun((x - mean)**2)  
  variance <- (1 / (len - 1)) * square_error  
  
  print(variance)  
}
```

and it can be called to print the variance of the range 6:36:

```
varFun(6:36)
```

```
