

Lab 3 Deliverable

```
## [1] "Author: Sebastian Hyland, 39878921"
```

First, let us load in the TSV data:

```
data <- read.table("data.tsv", header = TRUE, sep = "\t")
```

Now, we can verify that the shape of the dataframe is as expected:

```
print(dim(data))
```

```
## [1] 2128    6
```

```
print(colnames(data))
```

```
## [1] "ID"      "Age"      "Diagnosis" "Sex"      "variable" "value"
```

Finally, we can import `ggplot2` and create the violin plot, setting the “Sex” column as a factor:

```
library(ggplot2)
ggplot(data, aes(x = Diagnosis, y = Age, fill = factor(Sex))) +
  geom_violin()
```
