

Lab 5 Deliverable

```
## [1] "Author: Sebastian Hyland, 39878921"
```

First, let us load in the XLS data:

```
library(readxl)
data <- read_excel("dataset.xls", sheet = "Hoja3")
data
```

```
## # A tibble: 12 x 3
##   age height playtime
##   <dbl> <dbl>   <dbl>
## 1    10  66.4       2
## 2    11  67.5       4
## 3    12  68       5
## 4    13  69.9       6
## 5    14  70.1       8
## 6    15  71.4       9
## 7    16  72.3       1
## 8    17  73.1       3
## 9    18  74.1       3
## 10   19  75.3       1
## 11   20  76       6
## 12   21  77.6       7
```

Now, we can fit the model:

```
model <- lm(height ~ age + playtime, data = data)
```

And finally create the plot:

```
plot(model$fitted.values, model$residuals,
     xlab = "Fitted Values",
     ylab = "Residuals",
     main = "Residual Plot: Height vs Predicted Height"
)
```

Residual Plot: Height vs Predicted Height
